

Introduction to Web Applications

Report by Ezekiel Waweru CNS06-24049

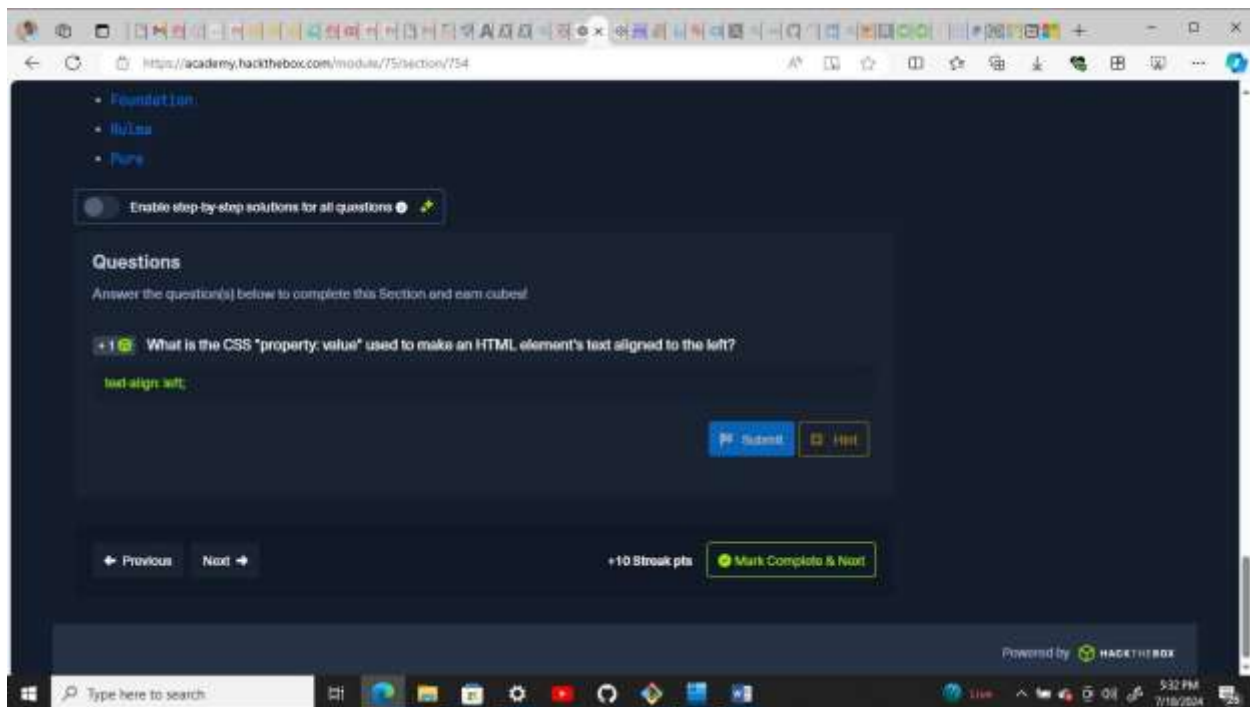

INTRODUCTION

In this assignment, I got the chance to learn more about web applications, their components and vulnerabilities. It was an enriching experience as now; I am better placed to be a better web penetration tester. Below are some of the question I tackled after completion of every section. With curiosity and appetite to learn, I got through this assignment.

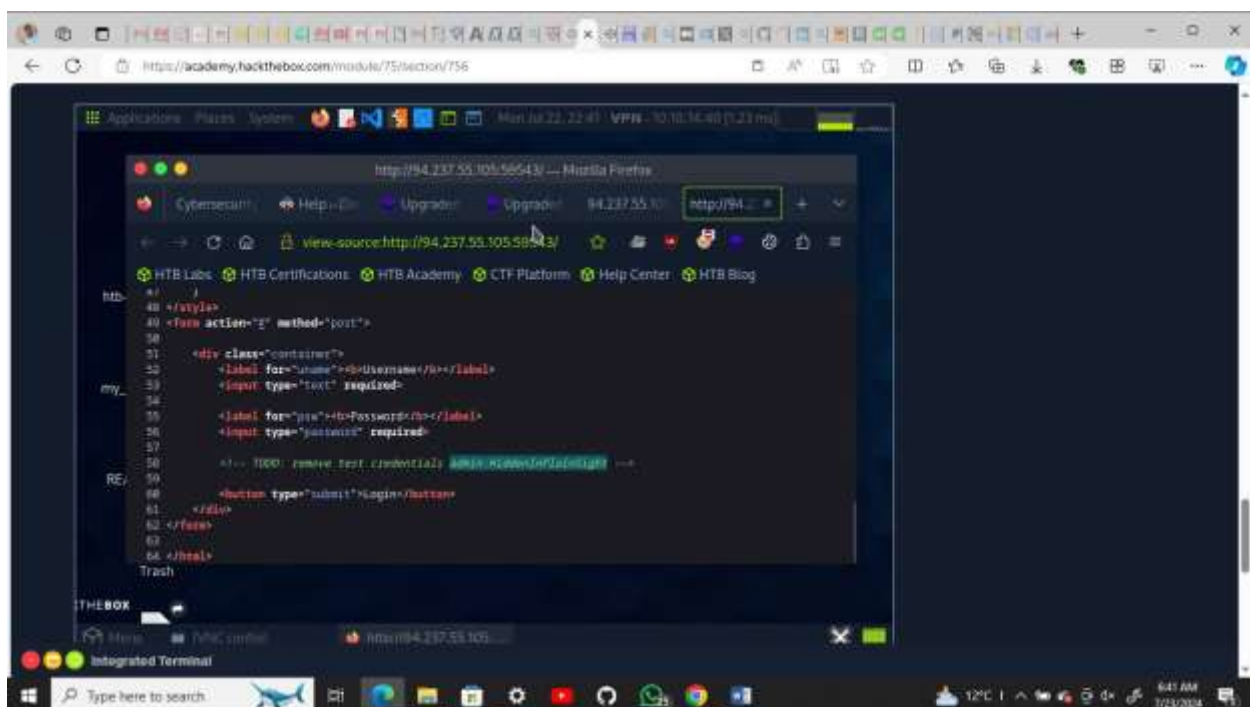

What is the HTML tag used to show an image?

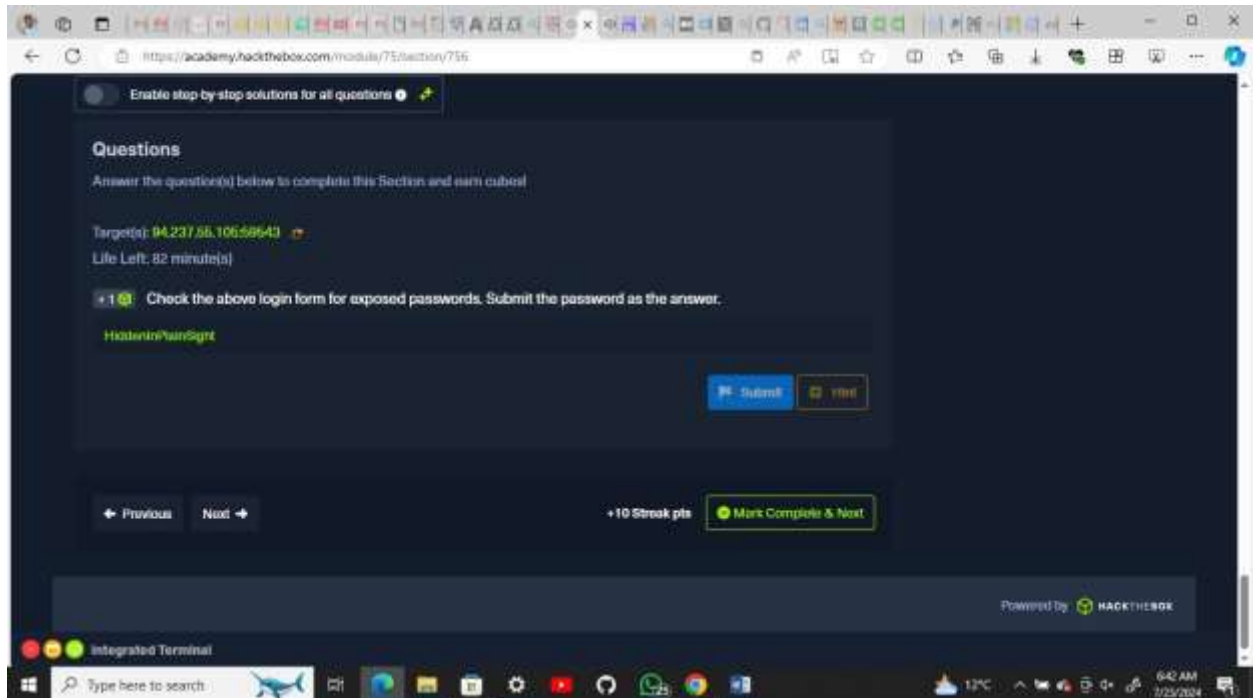

What is the CSS "property: value" used to make an HTML element's text aligned to the left?

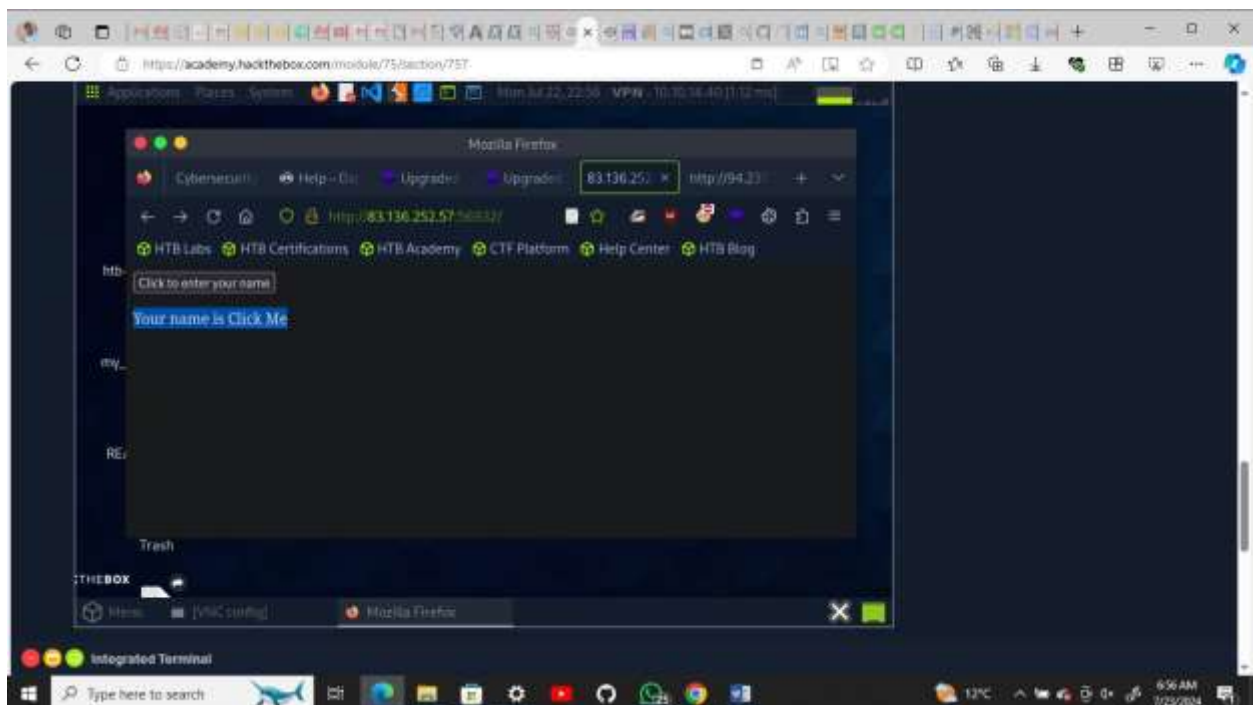

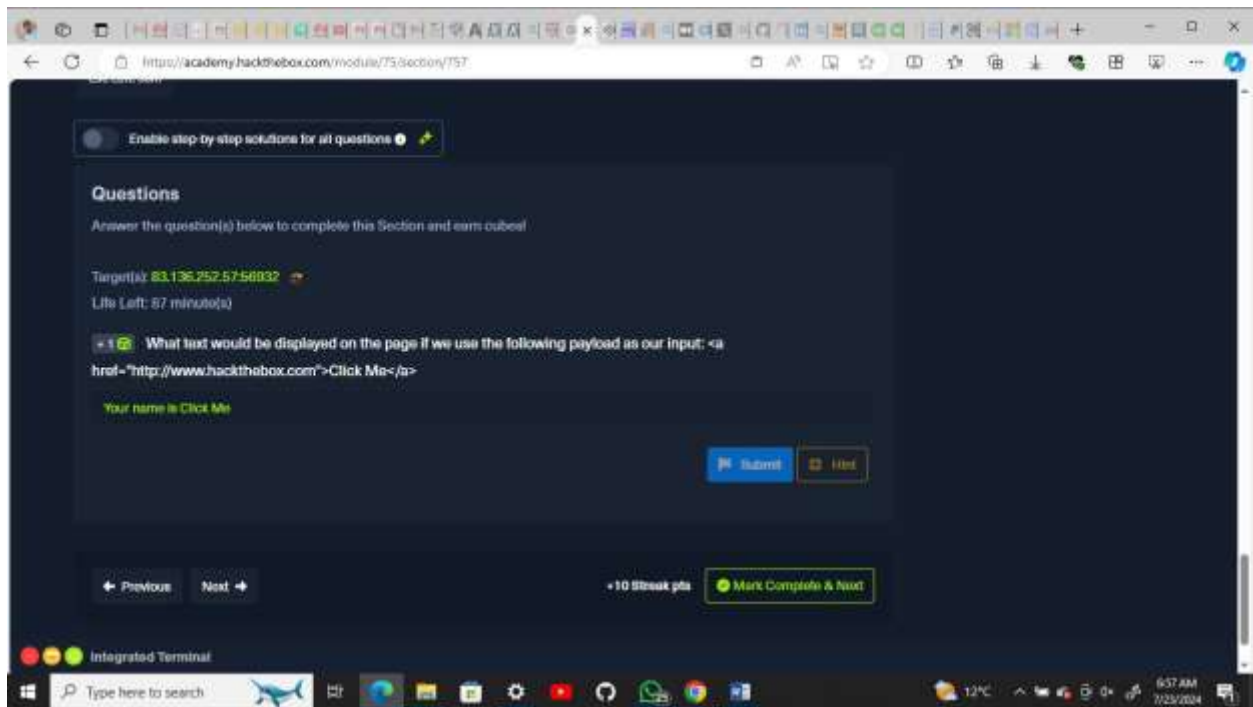

Check the above login form for exposed passwords. Submit the password as the answer.

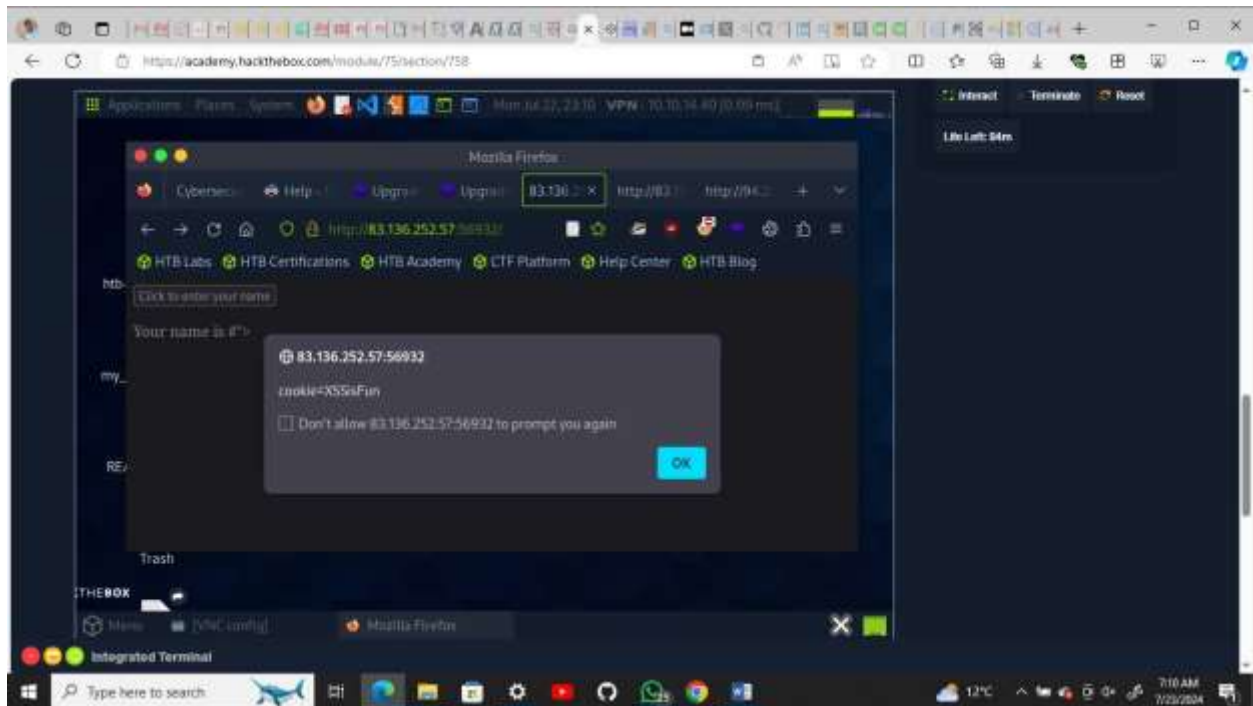

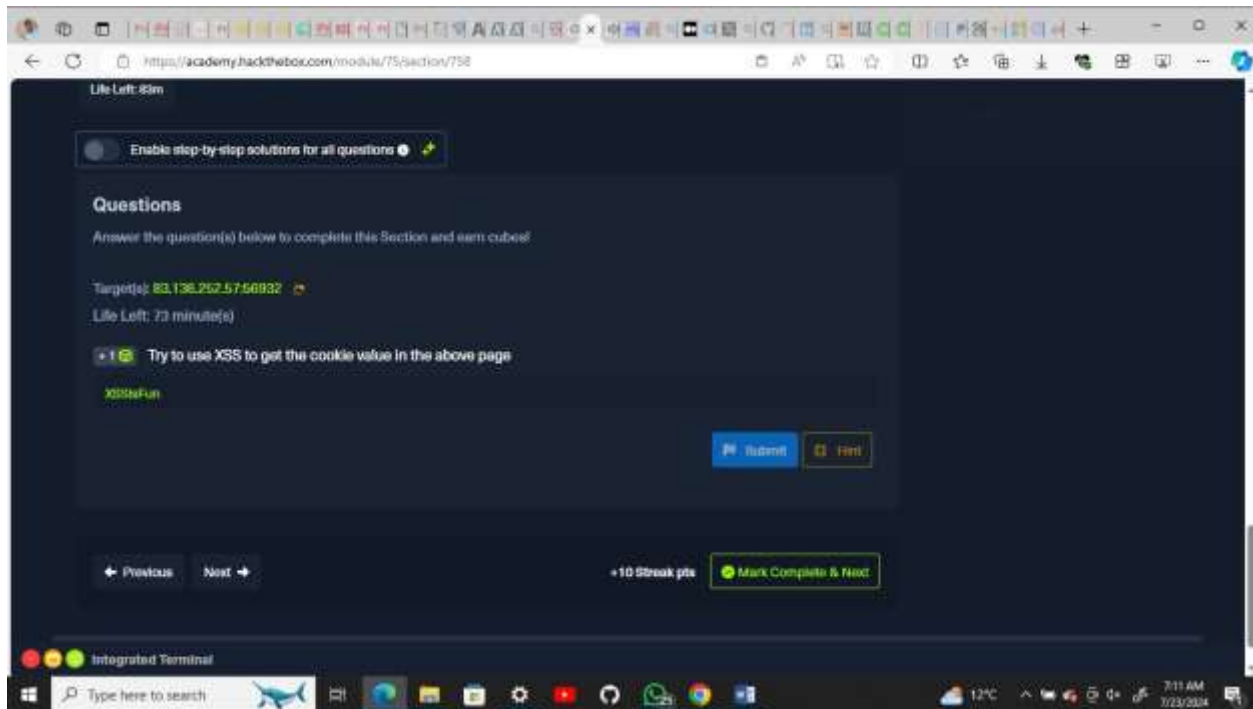

What text would be displayed on the page if we use the following payload as our input: `<a href="http://www.hackthebox.com">Click Me</a>`

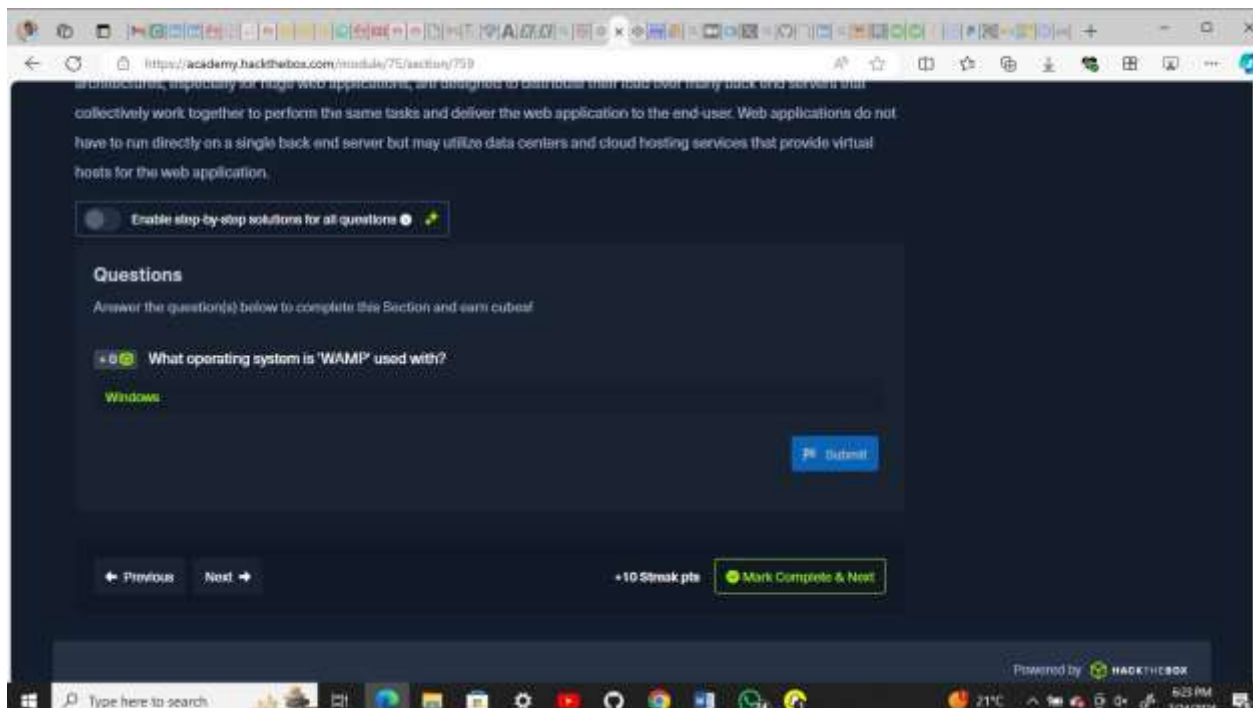

Try to use XSS to get the cookie value in the above page

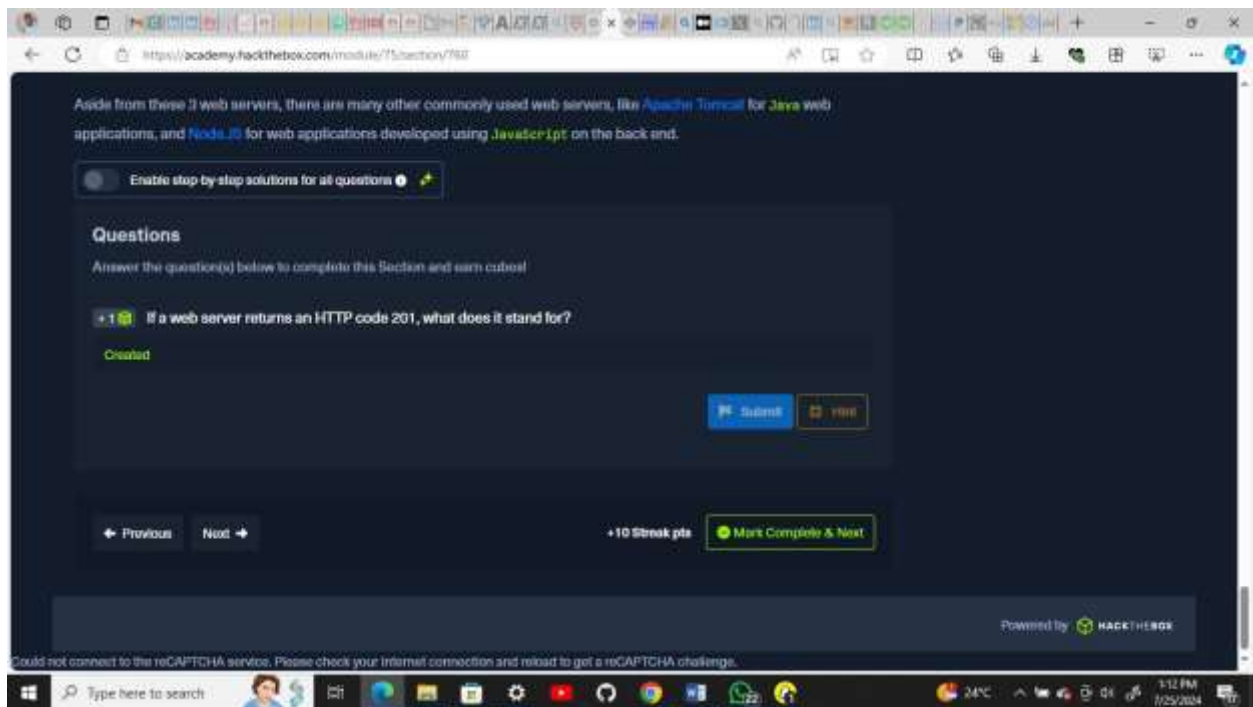

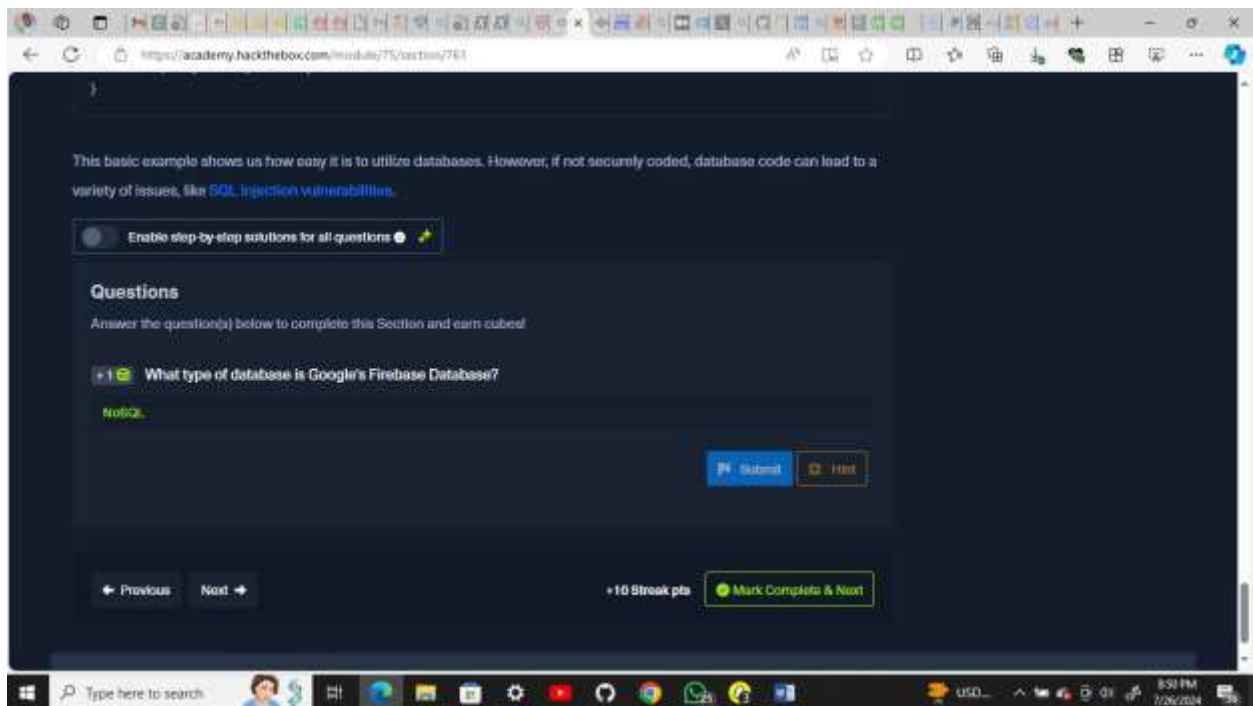

What operating system is 'WAMP' used with?

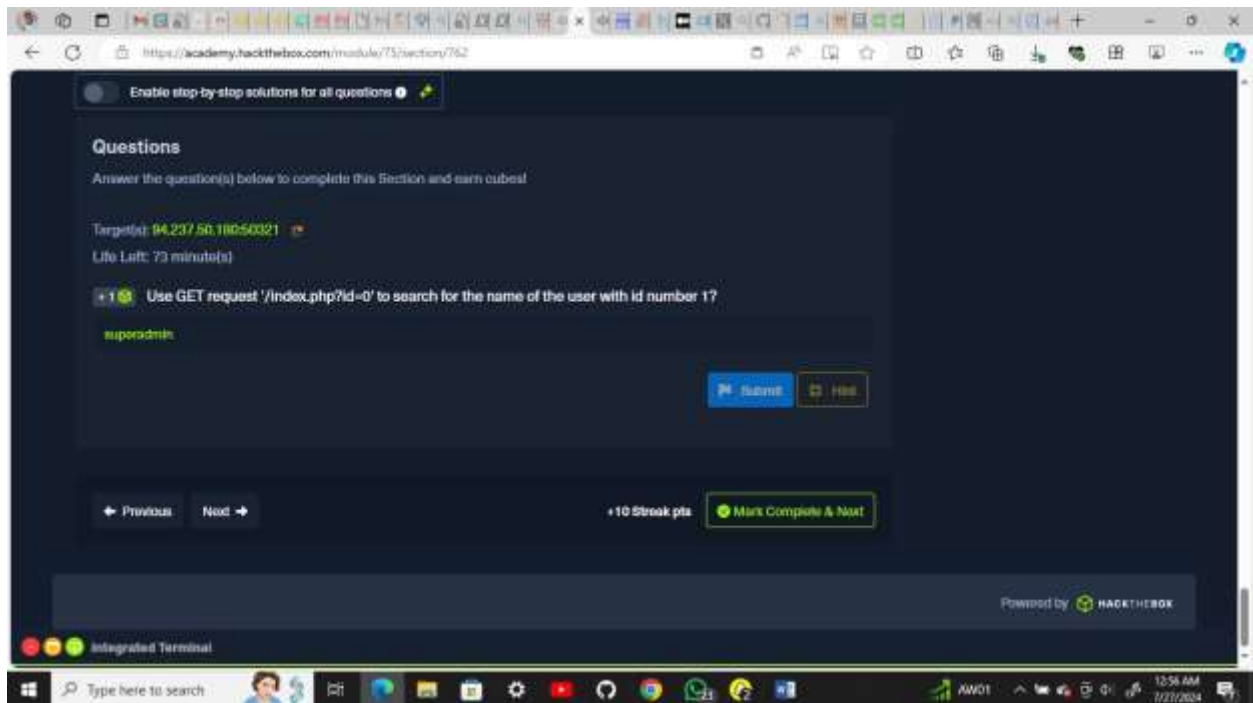

If a web server returns an HTTP code 201, what does it stand for?

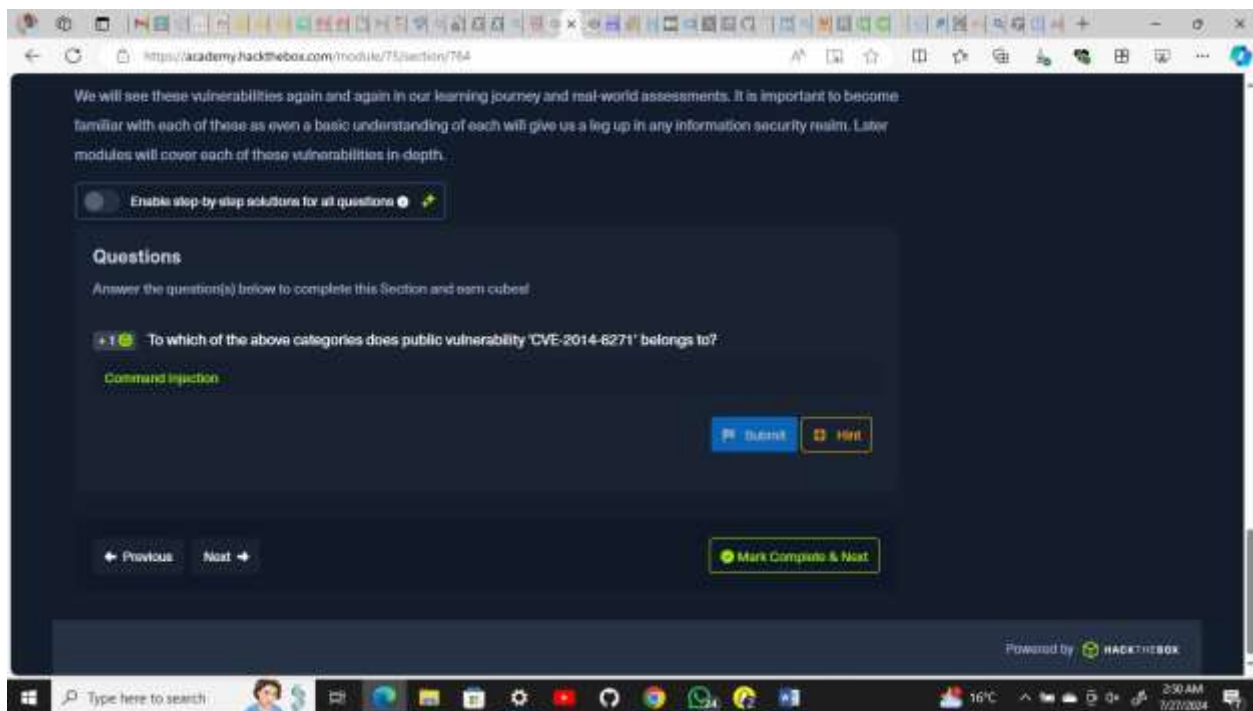

What type of database is Google's Firebase Database?

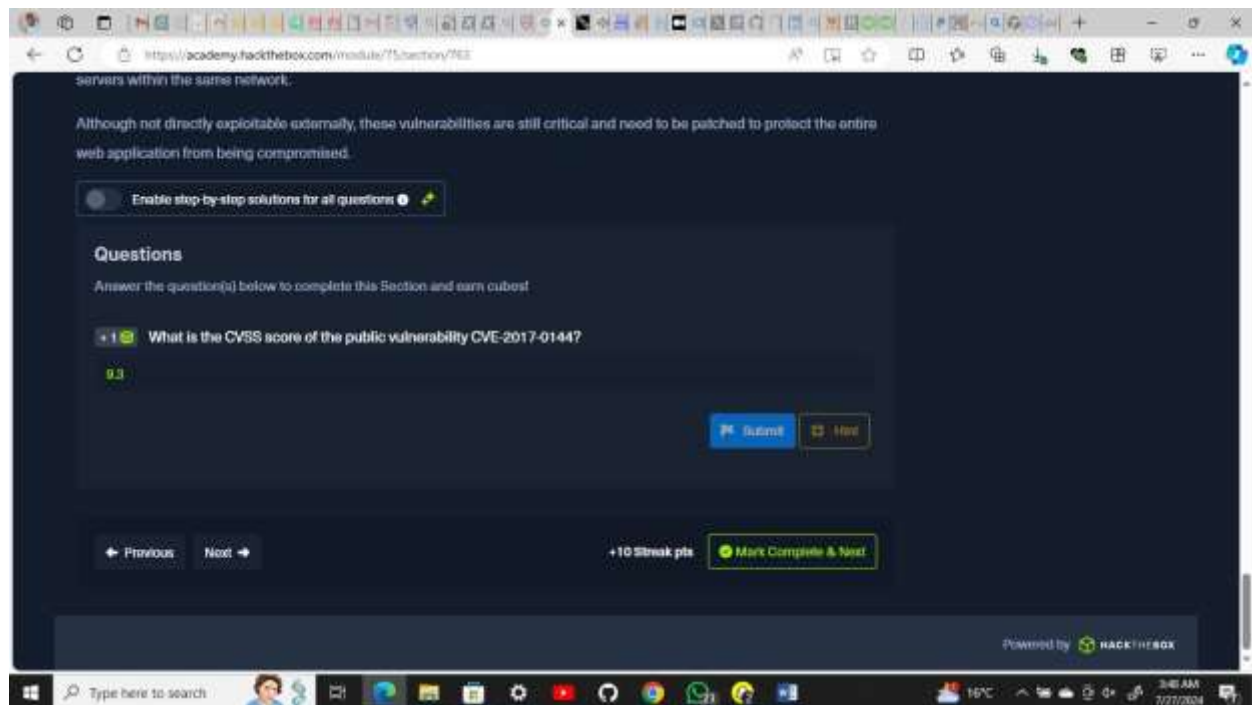

Use GET request '/index.php?id=0' to search for the name of the user with id number 1?

To which of the above categories does public vulnerability 'CVE-2014-6271' belongs to?

What is the CVSS score of the public vulnerability CVE-2017-0144?

Conclusion

Having completed the assignment, I have learnt more about back-end and front-end components, the languages used and their basic syntaxes, their vulnerabilities and how to exploit them, about frameworks and also on a bit more on databases than I knew. This assignment was exciting to complete as with every progression, I learnt something new. The biggest downside is that time worked against me but I am glad that I have now completed it and onto the next one.
